

Automatic Attendance System

Members

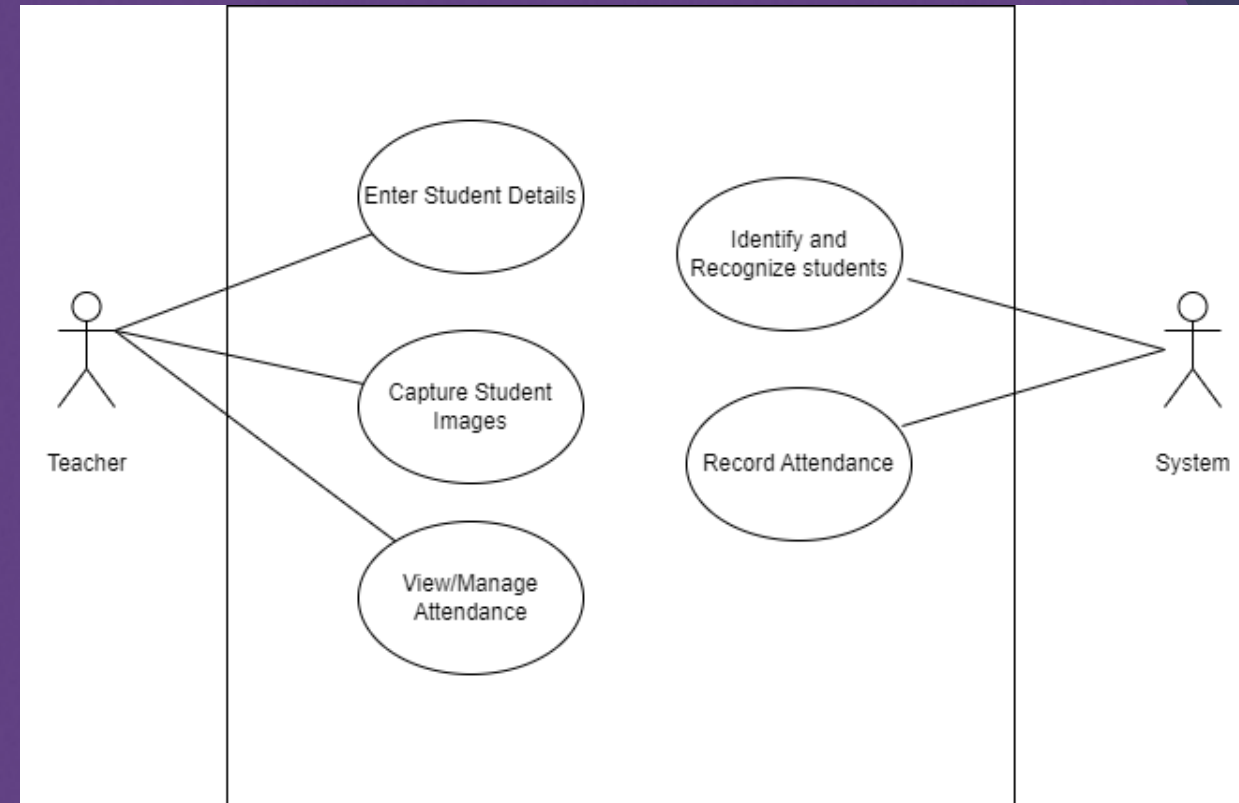

- Bishal Banstola
- Saroj Bhattarai

Problem Statement

- Most educational institutes still take students' attendance using traditional methods, wasting valuable teaching time.
- We need a system that automates this process and quickly and effectively records students' attendance.
- Automatic Attendance System will use a camera to recognize students' faces and mark their attendance.

Features and Functions

- Add students to classes and manage their attendance.
- Capture the images of students to identify them in the future.
- Recognize the faces of students and mark them as present in the class.
- Present the list of students in the class and check, based on the student's calendar, whether they are in the right classroom.
- If someone unidentifiable is in the class, take and record their photo

Technology Used

- Python
- JavaScript
- GitHub
